Violence Risk Assessment

Violence towards healthcare workers in acute care settings, particularly mental health units is increasing nationwide, causing safety and financial concerns for health care organizations. Efforts were made to decrease assaults directed towards healthcare staff on a twenty five bed adult mental health unit in a large academic university hospital. The aim of the project was to decrease assaults by twenty-five percent in six months after implementation of a Violence Risk Assessment (VRA) tool. The ultimate goal was to maintain assault rates below NDNQI. Assaults on the unit for the fourth quarter of 2015 were 2.92, NDNQI 2.05. Assaults with injury were 2.43, NDNQI 0.75. A literature review was performed to ascertain valid and reliable tools in predicting assaultive behavior which resulted in three VRA tools with high predictive value: the Broset Violence Checklist (BVC), Dynamic Appraisal of Situational Aggression (DASA), and Modified Overt Aggression Scale (MOAS). Each tool was piloted on the unit for two weeks followed by a survey to staff regarding their choice of tool based on risk assessment, ease of use, and acceptability (Appendix A). The DASA (Appendix B) was chosen by the staff and approved by the Nursing Steering Committee. Next steps include implementing the DASA tool in the electronic health record with follow up metrics to determine its effectiveness in identifying and decreasing assault potential. Recommendations include implementing EBP interventions to prevent violence for patients identified as assault risk.

Violence Prevention

Historically, the focus on inpatient units has not been the prevention or management of violence risk, but reacting to the violence after an incident. Violence on these units leads to physical, emotional, and economic consequences for perpetrators, victims, and the mental health system. Although short-term risk assessments have been developed to specifically address the risk for inpatient violence, these measures have only been implemented on the inpatient units and not in the Emergency Department (ED), which is often the first point of contact for the mentally ill. The purpose of the present study was to determine if a framework that uses structured professional judgment (SPJ) principles in the Emergency Department (ED) could predict violence within an inpatient unit. The Inpatient Violence Screening Tool (IPVST) SPJ framework was comprised of several pre-existing measures and four additional items culled from a literature review. These measures include the Brøset Violence Checklist (BVC; Almvik & Woods, 1998) and the Dynamic Appraisal of Situational Aggression (DASA-IV; Ogloff & Daffern, 2006a). A third short-term risk assessment, the McNiel Violence Checklist Revised (VSC and VSC-R; McNiel & Binder 1994), was coded based on files. Participants were 697 individuals who presented to the psychiatric ED at a general hospital and were interviewed by the Psychiatric Triage Nurses (PTNs). The follow-up sample was 207 patients who were subsequently admitted to an inpatient unit. The IPVST was completed by the PTNs after their interview; the VSC, VSC-R and outcome data were collected from files of the follow-up sample. The results of this study partially supported the use of the IPVST as a risk assessment framework in the ED to prevent inpatient violence. There was consistency in SPJ ratings amongst the majority of the PTNs. The IPVST total score and SPJ rating were significantly related to management strategies as well as significantly related to inpatient violence. The AUCs of the total scores of the IPVST and the individual measures were between .62-.65, except for the BVC, which was not a significant predictor of inpatient violence. The AUCs for the categorical risk rating of the BVC, DASA, VSC, and VSC-R were between .54-.64. Implications for risk assessment and management are discussed.

Violence Risk Assessment

This book explores the issue of violence in detail, taking into account the role of contextual factors, as well as the epidemiology, risk factors and clinical aspects of violence related to the main mental disorders. It also offers practical information on its management – from prevention to treatment. Covering all aspects of the problem of violence in mental disorders, the book is divided into four parts: general aspects; risk factors, phenomenology and characteristics of violence in mental disorders; contexts of violence; and prevention and management of violence in mental health. It also discusses violence in the various settings of mental health system, an aspect that has not previously been fully addressed. The volume is intended for all those who are interested in mental health, including scholars, professionals, and students.

The Handbook of Violence Risk Assessment, Second Edition, builds on the first edition’s comprehensive discussion of violence risk assessment instruments with an update of research on established tools and the addition of new chapters devoted to recently developed risk assessment tools. Featuring chapters written by the instrument developers themselves, this handbook reviews the most frequently used violence risk assessment instruments—both actuarial and structured professional judgment—that professionals use to inform and structure their judgments about violence risk. Also included are broader chapters that address matters such as the consideration of psychopathy and how the law shapes violence risk assessment. Already the primary reference for practitioners, researchers, and legal professionals in this area, this second edition’s easy-to-access, comprehensive, and current information will make it an indispensable reference for those in the field.

Violence Risk Assessment

With the world’s prison population continuing to grow and the number of secure inpatient beds in psychiatric hospitals on the rise, establishing valid and reliable methods of identifying individuals who will commit violent acts is an important global health and public safety issue. One approach to identifying future offenders is through the use of risk assessment--unstructured and structured methods of predicting the likelihood of antisocial behavior. Although much has been written on the performance of risk assessment in research settings, little is known about current standards of practice and relevant public policy across the globe. International Perspectives on Violence Risk Assessment includes chapters by leading risk assessment scholars in more than 15 countries and explores the topic from a truly international outlook. Using findings from the seminal International Risk Survey (IRIS), the largest qualitative study in the history of the field, current assessment, management, and monitoring practices on six continents are explored. Authors identify and describe the most commonly used risk assessment tools, examine risk communication preferences, and provide recommendations for mental health practitioners, criminal justice professionals, and legal professionals. Finally, authors review the seminal research studies, current practice guidelines, and relevant legal statutes of their jurisdictions. This volume serves as an invaluable resource for researchers, practitioners, and policymakers interested in this rapidly evolving field.

Violence Risk Assessment

This comprehensive Handbook of original chapters serves as a resource for clinicians and researchers alike. Two introductory chapters cover general issues in violence risk assessment, while the remainder of the book offers a comprehensive discussion of specific risk assessment measures. Forensic psychology practitioners, mental health professionals who deal with the criminal justice system, and legal professionals working with violent offenders will find the Handbook of Violence Risk Assessment to be the primary reference for the field.
