A compressor is a mechanical device that increases the pressure of a gas by reducing its volume. An air compressor is a specific type of gas compressor. Compressors are similar to pumps: both increase the pressure on a fluid and both can transport the fluid through a pipe. As gases are compressible, the compressor also reduces the volume of a gas. Liquids are relatively incompressible; while some can be compressed, the main action of a pump is to pressurize and transport liquids. Many compressor

Most commonly used in dry pipe and pre-action type sprinkler systems, we offer a complete range of air compressors that are specifically designed to meet the unique demands of a fire sprinkler application. A General Air Products fire protection air compressor arrives at the job site ready to meet the requirements in NFPA 13 for both fill up time (NFPA 13 7.2.6.2.2) and water delivery time (NFPA 13 7.2.3.6.1).

Foundation Design and Dynamic Analysis for large compressors. It is common practice to evaluate the foundation and ensure it will not be resonant with the compressor forces. Structural Vibration and Dynamic Design Analysis (FPSO, Platforms). Highly recommended for offshore applications as these facilities do not have the solid mass (e.g., concrete block) to properly support the compressor skid, so decks and beams on platforms and FPSOs are often resonant with the compressor(s) and engine(s).
